No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           H+-transporting

"Indolicidin, a novel bactericidal tridecapeptide amide from neutrophila.";
"J. Biol. Chem. 267:4292-4295(1992).
"I. FUNCTION: Potent microbicidal activity, active against Staphylococcus aureus and Eschericida coll.
"ITSSUE SPECIFICITY: Large granules of neutrophils.
"SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PIR; JC1222; JC1222.

"Coronavirus spike proteins in viral entry and pathogenesis.";

Virology 279:371-374(2001).

-I- FUNCTION: Structural protein that makes spikes at the surface of the virus. Determines enteropathogenicity and virulence of the virus. Initiates infection by specifically recognizing and binding the human aninopeptidase ANPEP receptor. Its association with ANPEP may lead to its conformational change that triggers fusion between viral and host cellular membrane.

-I- SUBUNT: Homotrimer. During virus morphogenesis, it is found in a complex with M and HE proteins (By similarity). Interacts with

"Phylogenetic relationships of the enigmatic hoatzin (Opisthocomus hoazin) resolved using mitochondrial and nuclear gene sequences.";

Mol. Biol. Evol. 16:1300-1307(1999).

-! FUNCTION: This is one of the chains of the nonenzymatic component (CFC) subunit) of the mitochondrial ATPase complex.

-! CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDINE=87270696; PubMed=3038094;

Madenodoxin reductase-adrenodoxin complex structure suggests electron transfer path in steroid biosynthesis.";
J. Biol. Chem. 276:2786-2789(2001).
-:-FUNCTION: Serves as the first electron transfer protein in all the mitochondrial p450 systems. Including cholesterol side chain cleavage in all steroidogenic tissues, steroid 11-beta hydroxylation in the adrenal cortex, 25-CH-vitamin D3-24 hydroxylation in the kidney, and sterol C-27 hydroxylation in the liver.
-:-CATALYTIC ACTIVITY: Reduced adrenodoxin + NADP(+) = oxidized
                                                                                                                                         SEQUENCE OF N-TERMINUS, AND PARTIAL SEQUENCE.

Submitted (DEC-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This is one of the chains of the nonenzymatic component
-(CF(0) subunit) of the mitochondrial ATPase complex.
-:- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
H(+)(Out).
                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hayashizaki Y.;
Functional annotation of a full-length mouse cDNA collection.";
Nature 409:685-690(2001).
Nature 409:685-690(2001).
Instruction: could be implicated in tissue-specific synthesis of long chain fatty acids and sphingolipids. May catalyze one or of the reduction reaction in fatty acid elongation, i.e., conversion of beta-kercacyl CoA to beta-hydroxyacyl CoA or reduction of trans-2-encyl CoA to the saturated acyl CoA

-!- FUNCTION: This is one of the chains of the nonenzymatic component (CF(0) subunit) of the mitochondrial ATPase complex.

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"The complete mitcohondrial genome sequence of a teleost, Salmo salar, and comparisons with other salmoniformes.";
Submitted (WAR-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This is one of the chains of the nonenzymatic component (CF(0) submit) of the mitcohondrial ATPase complex.
-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(IN) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SPECIES=0.mykiss; TISSUB=Liver;

Index complete nucleotide sequence of the mitochondrial DNA of the dogfish, Scyllorhinus canicula.";

Genetics 150:331-344(1998).

C -: FUNCTION: This is one of the chains of the nonenzymatic component (CF(0) subunit) of the mitochondrial ATPase complex.

C -: CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(2)O + M(2)Out).

C -: SUBCELLULAR LOCATION: Membrane-bound.

C -: SIMILARITY: Belongs to the ATPase protein 8 family.
                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Merazoa; Chordata; Craniata; Vertebrata; Chondrichthyes; Elasmobranchii; Galeomorphii; Galeoidea; Carcharhiniformes; Scyliorhinidae; Scyliorhinus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 36, Application US/09042071

j Sequence 36, Application US/09042071

j Patent No. 6294372

general information:

APPLICANT: Burian, Jan

APPLICANT: Burian, Jan

APPLICANT: Kay, William W.

TITLE OF INVENTION: SMALL CRYPTIC PLASMIDS AND METHODS FOR CONSTRUCTING

TITLE OF INVENTION: CONTROLLED-REPLICATION PLASMID VECTORS

NUMBER OF SEQUENCES: 52

CORRESPONDENCE ADDRESSS:

ADDRESSEB: SEED and BERRY LLP

STREET: 6300 Columbia Center, 701 Fifth Avenue

CUNTRY: Meathle

STATE: Washington

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 91; DB 3; Length 13; 100.0%; Pred. Cationic peptide(s) having anti-microbial activity - used for the inhibition of bacterial and viral growth, as an antitumour agent, and as a food preservative.

Claim 2; Page 65; 89pp; English.

```
ö
Dacteria, combined with activity against the medically important fungus Candida ableians. In addition, the peptides are useful as antitumour agents and/or antiviral agents. The peptides may be used as sterilants or preservatives of materials susceptible to microbial or viral contemination, e.g. in processed foods to inhibit Salmonalla, Yersina and Shigella. The peptides are compact and tend to have a unique polyproline type II extended helix structure that permits them to span the membrane with relatively few amino acids. The peptides possess the ability to work synergistically with antibiotics, and in addition, some of then possess anti-endotoxin activity. N.B. The present sequence represents SEQ ID No:1 in the claims and examples of the specification, but differs slightly from the SEQ ID No:1 in the sequence listing on page 51 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MBILL is a small (mcl.wt. 1879) cationic peptide. DNA encoding MBILL has been incorporated into vector pR2h-B1, in which the replication leader (RIL) sequence of RepA (see also AMA71686) is joined to 2 Hpro peptides (see also AAM71692), to provide a vector for expression of MBILL in host cells. The invention provides controlled replication plasmid vectors (RAMP vectors) comprising a replication origin of a small cryptic plasmid and a gene encoding RepA. The vectors can reach very high levels of plasmid replication, but are not lethal to the host cell, and can be used to direct the high level expression of e.g. cytokines, antigens and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a specifically claimed cationic peptide from the present invention. The present invention describes compositions and methods for treating infection, especially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance, (b) acquired resistance, and (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity against a microorganism that is tolerant, inherently resistant, or has acquired resistance to an antibiotic agent. They can be used for killing e.g. bacteria, fungi, parasites and viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New indolicidin peptide analogues - useful for, e.g. enhancing activity of antibiotic or overcoming tolerance, acquired resistance or inherent resistance of microorganisms.
                                                                                                                                                                                                                                                                                   Indolicidin analogue, resistance, cationic peptide, antibiotic;

RESULT 4

Sequence 13 AA

Cellulose binding domain; CBD; cationic peptide; MBI-11; indolicidin; bovine.

MBI-11 peptide derived from indolicidin.

(first entry)

20-SEP-2000

AAY94495;

AAY94495 standard; peptide; 13 AA.

```
AAY24549 to AAY24615 represent indolicidin analogues of formulae (I)-
(VIII) containing up to 25 amino acids (aa): RXZXXZXB (I), BXZXXZXB (II),
BBBXZXXXXB (III), BXZXXZXBBB(AA) MILIBBAGS (IV), BXZXXZXBB (AA) MM (V),
LBBDXZMXZXZXKK (VII), LKNZXXZXXRK (VII) and BRXZXXZXBB (AIII). Where Z
COFK, AA = any aa, n = 0 or 1; in (II), at least 1 Z = V; in (VIII) at
least 2 X = F or Y. The analogues are used to treat infections caused by
bacteria (Gram positive or negative, or anaerobic); fungi (yeast or
moulds); parasites (protozoa, nematodes, cestodes or trematodes) or
viruses. Typical of very many pathogens, that can be controlled are
Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica,
Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus aureus,
Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived
from the analogues may be used seinilarly; the compounds may also be
prepared from antibiotics or antiarrythmic agents. The analogues may be
used therapeutically or to coat medical and expense.
Cor herbicides, or as preservatives for foods and technical materials. The
analogues are administered by injection, lavage, orally or topically,
generally at 0.1-50 mg/kg. These analogues have a broader spectrum of
activity than indolicidin and modification as compounds reduces their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New indolicidin analogues with antimicrobial activity and related nucleic acid - vectors, transformed cells and antibodies, also conjugates with polyoxyalkylene glycol and fatty acid to reduce toxicity, useful therapeutically, as disinfectants etc.
                                                                                                                                                                   Indolicidin; bacterial infection; photo-oxidised solubiliser; antihicrobial; antibiotic; antiarrythmic; surface disinfectant; additive; shampor; soap; insecticide; herbicide; preservative; food; technical material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 13;

A novel method allows the efficient production of cationic peptides in recombinant host cells. The method involves construction of a multidomain fusion protein expression cassette comprising a promoter and a nucleic acid molecule expressed as an insoluble protein. The inclusion of anionic peptide sequences in the linker sequences neutralises the positive charge of the cationic peptide so that the charge of the fusion of the cationic peptides to that the charge of the fusion of the cationic peptides such as bovine indolician may be used as antimicrobial agents. The present sequence is the MBI-11 peptide. MBI-11 is a cationic peptide derived from modifications of

indolicidin

Multi-domain fusion protein expression cassette used for high yield stable production of foreign peptide gene products.

                                                                                                                                                                                     This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenovype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leuksemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cationic peptide; tumour; pharmaceutical composition; cancer; treatment; leukaemia; polyoxyalkylene-modified; APO; lymphoma; multiple myeloma; breast; lung; ovary; cervix; uterus; skin; prostate; liver; colon;

This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistent phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò

                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon

This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalxylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
Cationic peptide; tumour; pharmaceutical composition; cancer; treatment; bridkeemis; polyoxyalkylene-modified; APO; lymphoma; multiple myeloma; breast; lung; ovary; cervix; uterus; skin; prostate; liver; colon; multidrug resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Magainin, antimicrobial, transgenic plant; protease degradation; Rev4; indolicidin; protein production; reverse peptide.

The present invention describes an antibacterial compound (1), comprising a conjugates of glycopeptide and peptidic membrane-associating elements.

(1) comprises the formula VL-W-X, where: V = a glycopeptide molety that inhibits peptidoglycan biosynthesis in bacteria; L = a linking group; W = c a peptidic membrane-associating element; and X = H or a membrane-c insertive element. Also described: (1) a method of treating or preventing configuration comprising the administration of (1); and (2) use of a bacterial infection. (1) are used in the manufacture of a medicament or prophylaxis of a bacterial infection in a human or configural body, including both the gram positive and gram negative bacteria including Mycobacterium Sp., Buterococcus Sp., Borrelia Sp., Actinomyces Sp., Hemophilus Sp., Clostridium Sp., Berteriolaria Sp., Actinomyces Sp., Hemophilus Sp., Clostridium Sp., Perdomonas Sp., Actinomyces Sp., Pervent adhesion of bacterial confirms provide the available of prophylaxis. (1) are also useful as wound treatment agents to metrix proteins, especially fibrosectin, prevent adhesion of bacterial confirms proteins associated biosynthetic proteins. Consuming the hospholipids than the eukaryotic organisms, also having a higher proportion of acidic phospholipids than the eukaryotic organisms, also with (1) and is effective to treat the antibiotic resistant bacterial communistical pages of the present invaries in peptides given in the communistical pages of the present invaries of the present invaries.
                         Antibacterial compound, useful for the treatment of a bacterial infection by e.g. gram positive or negative bacteria, comprises a conjugate of glycopeptide and peptidic membrane-associating element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antimicrobial; cationic; viscosity-increasing agent; solvent; buffer; antibacterial; virucide; antiinflammatory; fungicide; protozoacide; parasticides, vulnorary; dermatological; herbicide; insecticide; infection; systemic infection; sepsis; acne; disinfectant; herbicide; insecticide; silicone sealant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 91; DB 5; Length 13; larity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                Indolicidin is a potent antimicrobial tridecapeptide, originally purified from cytoplasmic granules of bovine neutrophils. CP-11 is an analogue, which has better activity against E coli Pseudomonas aeruginosa and candida albicans, but reduced activity against Staphylococcus aurents. reverse peptide, Rev4 (AAY22796) of indolicidin was found to have increased teability against plant proteases degradation. Expression of antimicrobial peptides in transgenic plants suffers a major limitation in that the foreign peptides are susceptible to rapid degradation by proteases. The invention concerns reducing the extent of protease degradation of a protein applied to, or produced by a plant by administering indolicidin, Rev4 or a functional equivalent to the plant. Transgenic plants expressing indolicidin and Rev4 are useful for production of the antimicrobial peptides. Compositions containing indolicidin and Rev4 are useful for indolicidin and Rev4 are useful for indolicidin and Rev4 are useful for production of agronomically indolicidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibacterial; glycopeptide; peptidic membrane associating element; bacterial infection; vancomycin; peptidoglycan biosynthesis inhibition;

The present invention describes a composition (A) comprising an antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and antimicrobial cationic peptide (I), a viscosity-increasing agent (III) and cationic peptide (II) acomposition comprising (I), buffer (IV) and (III). (I) has antibacterial, vincide, antihifiammatory, fungicide, protozoacide, parasiticide, vulnerary, dermatological, computation of microflora (eukaryotes, prokaryotes or viruses) at a target of population of microflora (eukaryotes, prokaryotes or viruses) at a target site, particularly for treatment or prevention of infections. They can be used to creat a wide range of systemic infections (e.g. sepsis) and for cosed to reat medical devices have been, or will be, inserted into the body (alternatively, they are used to treat the devices); and (ii) at sites on the skin (particularly for treating acno) or the mucosa. The devices treated are especially central venous, vascular dialysis, pulmonary created are especially for treatment of clothing and air filters; in cosmetics and soaps; as herbicides and insecticides; in building compariate (e.g. siliceone sealants) and in processing animal products, e.g. bides. The present sequence represents an antimicrobial actionic peptide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                     Composition containing stabilized antimicrobial cationic protein, useful for treating infections, particularly where associated with in-dwelling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antimicrobial; cationic; viscosity-increasing agent; solvent; buffer; antibacterial; virucide; antiinflammatory; fungicide; protozoacide; parasiticide; vulnerary; dermatological; herbicide; insecticide; infection; systemic infection; sepsis; acne; disinfectant; herbicide; insecticide; silcone sealant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 91; DB 6; Length 12. Pred, No. 2.1e-06;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a composition (A) comprising an antimicrobial cationic peptide (I), a viacosity-increasing agent (II) and a solvent (III). Also described is a composition comprising (I), buffer (IV) and (III). (I) has antibacterial, virucide, antiinflammatory, fungicide, protozoacide, parastricide, vulnerary, dermatological, herbicide and insecricide activities. (A) can be used to reduce the population of microfilora (eukaryotes, prokaryotes or viruses) at araget site, particularly for treatment or prevention of infections. They can be used to treat a wide range of systemic infections (e.g. sepsiss) and for topical treatment of wounds, but most especially can be used it) at sites where medical devices have been, or will be, inserted into the body it sites where medical devices have been, or will be, inserted into the body the skin (particularly for treating acne) or the mucosa. They devices treated are especially central venous, vascular dialysis, pulmonary are used to treat the devices trey peritoneal dialysis or umbilical catheers. They may also be used as surface disinfectants; for treatment of clothing and at intents; in cosmetics and soaps; as herbicides and insecticides; in building can be used as surface disinfectants; for treatment of clothing and at intents, commetrials (e.g. silicone sealants) and in processing animal products, e.g. thdes. The present expresents an antimicrobial cationic peptide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                           Composition containing stabilized antimicrobial cationic protein, useful for treating infections, particularly where associated with in-dwelling devices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antimicrobial; cationic; viscosity-increasing agent; solvent; buffer; antibacterial; virucide; antiinflammatory; fungicide; protozoacide; parasiticide; vulnerary; dermatological; herbicide; insecticide; infection; systemic infection; sepsis; acne; disinfectant; herbicide; insecticide; silicone sealant.

(MICR-) MICROLOGIX BIOTECH INC. 21-AUG-2001; 2001US-0314232P. 20-AUG-2002; 2002US-00225087.

Mcnicol PJ, Fraser JR; Krieger IJ,

Composition containing stabilized antimicrobial cationic protein, useful for treating infections, particularly where associated with in-dwelling WPI; 2003-332767/31.

Claim 47; Page 48; 90pp; English.

devices.

The present invention describes a composition (A) comprising an antimicrobial cationic peptide (I), a viscosity-increasing agent (II) and a solvent (III). Also described is a composition comprising (I), buffer (IV) and (III). (I) has antibacterial, virucide, antiinflammatory, the antibacterial, virucide, antiinflammatory, fungicide, protozoacide, parastricide, vulnerary, dermatological, persistence, parastricide, vulnerary, dermatological, perplaid of microfica activities, (A) can be used to read a target site, particularly for treatment or prevention of infections. They can be set to treat a wide range of systemic infections (e.g. sepsis) and for topical treatment of wounds, but most especially can be used; (i) at sites where medical devices have been, or will be, inserted into the body caterntively, they are used to treat the devices) and (ii) at sites on the skin (particularly for treating acne) or the mucosa. They devices treated are especially central venous, vascular dialysis, pulmonary are treaty. peritomeal adialysis or umbilical catheters. They may also be used as surface disinfectants; for treatment of clothing and air filters; in cosmetics and soaps; as herbicides and insecticides; in building community and present sequence represents an antimicrobial cationic error peptide, which is used in the exemplification of the present invention.
